### ④ Definition of Motor

Motor is a machine to get a driving force for rotation or straight movement by converting the electrical energy into mechanical energy and the light-weighted motor which enables to select the model suitable for the load, has less noise and vibration as well as no exhaust pollution.

### ④ Features of DKM AC Motor

DKM AC geared motor was developed first in Korea in 1987 and has been used in a good reputation throughout the whole areas of domestic/overseas industry up to know. Our AC geared motor is proud of various and wide range of specification which satisfies various electrical requirements from all over the world.

#### ⑤ Various and Abundant Models

- There are various and abundant models in frame size covering □ 60/70/80/90mm such as Induction Motor, 2 Pole Motor, Reversible Motor, E.M. Brake Motor, Clutch & Brake Motor, Torque Motor and Speed Control Motor.
- For use voltage, we have various voltage specification covering all areas in the globe: 100V 50/60Hz(Japan), 200V 50/60Hz(Japan), 110V 60Hz(Taiwan), 220V 60Hz(Korea, Taiwan), 115V 60Hz(North America), 230V 50Hz(Europe, Oceania), 220V/240V 50Hz(South-East Asia)

#### ⑤ Low Noise and Low Vibration

- Due to the enhancement of quality standard such as places and conditions for motors to use, the low noise and low vibration are required.
- To satisfy these conditions, we employed high precision of gear processing and skiving cutting method and we are making a rotor which is the root cause of vibration by verifying with balance machine for low noise and low vibration.

#### ⑤ Easy to Use

- Easy and safe to use as motor and gearhead are sold according to the requirements so that it can be designed and manufactured optimally.
- It is easy to drive to get a driving force by connecting capacitor to the commercial power available to be used anywhere and anytime. As capacitor is not needed for three phase power, it is available to get a driving force easily by connecting three phase power to the motor directly.

#### ⑤ Just-In-Time System

- Just-In-Time system is available in DKM Motor Co., Ltd. for the best delivery system. DKM realized user's satisfaction with the world best delivery system.

### ④ Types of Motor

#### ⑤ Classification by Power

- **AC motor:** A motor operated by AC power. For example, inductive motor, synchronous motor, AC commutator motor etc.
  - 1) **Single Phase Motor**
    - Single phase power is composed of one phase as commercial power for home.
    - As power itself does not make motor rotate, capacitor is connected to auxiliary coil to start.
  - 2) **Three Phase Motor**
    - Three phase motor stands for electrical power and it is consisted of three electrical sources with a phase offset of 120° in voltage.
    - Connect the power to motor to start and the rotor will start to run easily.
    - The efficiency of motor is high and the starting torque is relatively big.
- **DC motor:** A motor which rotates by supplying the direct current to the armature. The torque generated by placing the coil between magnetic poles N and S and applying the current to this coil rotates the motor. Whenever this coil passes the neutral shaft, it turns the direction of current reversely and rotates continuously

## Classification by Function

### Motor with Constant Speed

**1) Induction Motor:** An induction motor is a type of AC motor where power is supplied to the rotor by means of electromagnetic induction. These motors are widely used in industrial drives, particularly polyphase induction motors, because they are rugged and have no brushes. Their speed is determined by the frequency of the supply current, so they are most widely used in constant-speed applications, although variable speed versions, using variable frequency drives are becoming more common.

**2) Reversible Motor:** A kind of induction motor and a motor having the same characteristic in any direction such as left turn or right turn. In principle, it is same as induction motor but there is no relation of main coil and auxiliary coil like general induction motor in order to stand frequent normal/reverse rotation and get a big starting torque.

### Electromagnetic Brake Motor

It is a motor embedded with fail-safe electromagnetic brake. Perfect braking enables to get a staying power. Brake runs only when the power is shutdown, so this is suitable as a brake for safe use.

\* DKM has 'A Type' electronic brake motor which runs when the power is applied. (Customized specification)

### Clutch & Brake Motor

DKM Clutch & Brake motor is equipped with Clutch & Brake mechanism available to be used with gearhead. As the continuously rotating induction motor and Clutch & Brake are combined, this can be used for frequent start/stop, position control, index operation and relative value feeding operation etc.

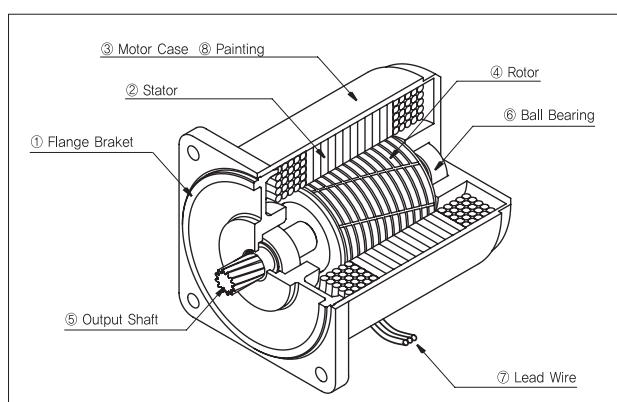

### Torque Motor

DKM torque motor has big starting torque and sloping characteristics. It runs safely over the whole area of rotation speed-torque characteristics. (Torque is highest at zero speed and decreases steadily with increasing speed.) With these characteristics, this can be used for more application as a winding or tension motor.

### Speed Control Motor

User can easily set and adjust the motor speed. There are three kinds of speed controller for AC speed motors. Select the best system depending upon your application.

## Structure of AC Motor

### ① Flange Bracket

Die-cast aluminum bracket is press-fitted into the motor case. The flange and the housing are a single body type which plays an important part to attach the motor alone or combine the gearhead.

### ② Stator

This is comprised of a stator core made from laminated silicon/steel plates, a polyester-coated copper coil and insulation film. The roles are to generate magnetic field, form the rotation and run the rotor.

### ③ Motor Case

Die-cast aluminum with a machined finish inside

### ④ Rotor

It is comprised of laminated silicon/steel plates with die-cast aluminum. Rotor plays the part to change the electric energy to mechanical energy and transfer it to outside through shaft.

### ⑤ Output Shaft

There are round type shaft, D-cut type shaft, key type shaft which are for using by motor itself and gear type shaft (pinion shaft) which is for attaching gearhead. It is made by S45C with a machined finish.

### ⑥ Ball Bearing

It ensures that the rotor remains at the right position for the reliability and fast rotational motion.

### ⑦ Lead Wire

Lead wires with heat-resistant polyethylene coating

### ⑧ Painting

Backed finish of acrylic resin and melamine resin with beautiful look

### ④ Temperature Rise of AC Motor

#### □ Temperature Rise

- In operation of motor, the loss inside of motor is changed to heat causing the motor's temperature to rise.
  - Induction Motor (for continuous duty) reaches the saturation point of temperature rise in about two or three hours of operation and temperature stabilizes.
  - Reversible Motor (30 minutes rating) reaches their limit of temperature rise in about 30 minutes of operation. If operation continues as it is, the temperature will increase further.

#### □ Measuring Temperature Rise

- DKM uses the following methods for temperature measurement and for the determination of a motor's allowable temperature rise.
  - Thermometer Method: The temperature rise at which the temperature rise becomes saturated during motor operation is measured by using a thermometer or thermocouple installed in the center of the motor case. The temperature rise is the difference between the ambient temperature and measured temperature during motor operation.
  - Resistance Method: This is the way of measuring the winding temperature according to the change in resistance value. The motor's winding resistance and ambient temperature is measured by using a resistance meter and thermostat.

#### □ Overheating Protection Device

- In case of that a running motor locks due to overload or the input current increases due to any reason or ambient temperature increases suddenly, the motor's temperature rises abruptly. If this state continues, the insulation performance may deteriorate and, in extreme cases, it may cause a fire. To avoid this case, DKM employs the following overheating protection devices.

- **Thermal Protector (TP)**

DKM installs the thermal protector for overheating protection of the motor. The TP employs a bimetal contact with pure silver used in the contacts. Pure silver has the lowest electrical resistance of all materials and has thermal conductivity second only to copper.  
(Operating Temperature: Open 120°C±5°C / Close 90 °C±5°C)

- **Impedance Protection**

Impedance-protected motor has higher impedance in the motor windings so although the motor locks, the increase in input current is minimized and temperature will not rise.

#### □ Insulation Class

- DKM Motor's insulation class is B class. Insulation class is according to heat-resistance class. According to JIS C4003(IEC60085), it is defined as below. It is also available to use other materials for some particular insulation class according to operating conditions or user's request. (Customized specification)

Insulation Class	Max. Permissible Temp.
Y	90°C
A	105°C
E	120°C
B	130°C
F	155°C
H	180°C

#### □ FAN

- It is available to attach two kinds of fan to the DKM's motor; 'General Fan (F type)' and 'Powerful Fan (F2 type)'. General fan is attached to motor shaft rotating in same speed as that of motor shaft. (1,800r/min in 60Hz, 1,500r/min in 50Hz) Powerful fan makes powerful cooling performance rotating in high speed regardless of motor shaft speed. (3,200r/min in 60Hz. Temperature reducing over 10°C is available comparing general fan.)
- DKM employs general fan to the motors with continuous speed and employs powerful fan by customers' special order to the continuous speed's motor. But in case of speed control motor in which speed control is needed, powerful fan is employed basically because there is little cooling effect in low speed if general fan is used.

## Equipment Protection Structure (IP Code)

- The IP code is one of the equipment protection structures and indicates the dust-resistance and waterproofing degrees of protection for the equipment.
- The code consists of the first number and the second number.

- "X" is used when one of the two protection classes is not specified in the name. (e.g. IPX5, IP4X)
- Meanings of IP code and testing conditions are as below;

### 1) The Classification of Dustproof

IP Code	Protection Specifications for Dustproof		
	First Number	Protection Level	Test Condition
IP0□	None		None
IP1□	Protection against approach by hands	Solid objects with a diameter of 50mm or more do not enter.	
IP2□	Protection against approach by fingers	Solid objects with a diameter of 12mm or more do not enter.	
IP3□	Protection against tips of tools etc.	Solid objects with a diameter of 2.5mm or more do not enter.	
IP4□	Protection against ingress of wires etc.	Solid objects with a diameter of 1.0mm or more do not enter.	
IP5□	Protection against powdery dust	Powdery dust that may inhibit normal operation does not enter.	
IP6□	Completely dustproof design	Cannot be penetrated by powdery dust.	

### 2) The Classification of Waterproof

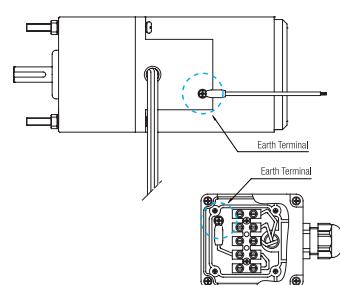

IP Code	Protection Specifications for Waterproof		
	Second Number	Protection Level	Test Condition
IP□0	None		None
IP□1	Protection against water drops falling vertically	Water drops at a rate of 3 to 5L/min. for 10 minutes from a height of 200mm	
IP□2	Protection against water drops from directions within a range of 15° relative to the vertical plane	Water drops at a rate of 3 to 5L/min. for 10 minutes from directions within 15° from a height of 200mm	
IP□3	Protection against raindrops from directions within a range of 60° relative to the vertical plane	Sprayed water at a rate of 10L/min. for 10 minutes from directions within 60° from a height of 200mm	
IP□4	Protection against ingress of splashes from all directions	Sprayed water at a rate of 10L/min. for 10 minutes from all directions at a distance of 300 to 500mm	
IP□5	Protection against water jet from all directions	Sprayed water jet of 30kPa at a rate of 12.5L/min. for 3 minutes from all directions at a distance of 3m	
IP□6	Protection against strong water jet such as ocean waves	Sprayed water jet of 100kPa at a rate of 100L/min. for 3 minutes from all directions at a distance of 3m	
IP□7	Usable after immersion in water under specified conditions	Immersion to a depth of 1m for 30 minutes	
IP□8	Usable under water	Determined through cooperation between user and manufacturer.	

- The IP code of DKM's motor is indicated in the name plate (motor label).

## Earth Method

### Lead Wire Type

- As shown in the figure, connect the earth wire to the earth hole in the side of the motor.  
Screw the earth wire to the earth hole. (Sequence: earth hole → washer → earth wire → screw bolt)

### Terminal Box Type

- Connect the earth wire to the earth terminal in the terminal box.

## AC Motors

### Outline of Induction Motor

#### 适合于单向连续运行

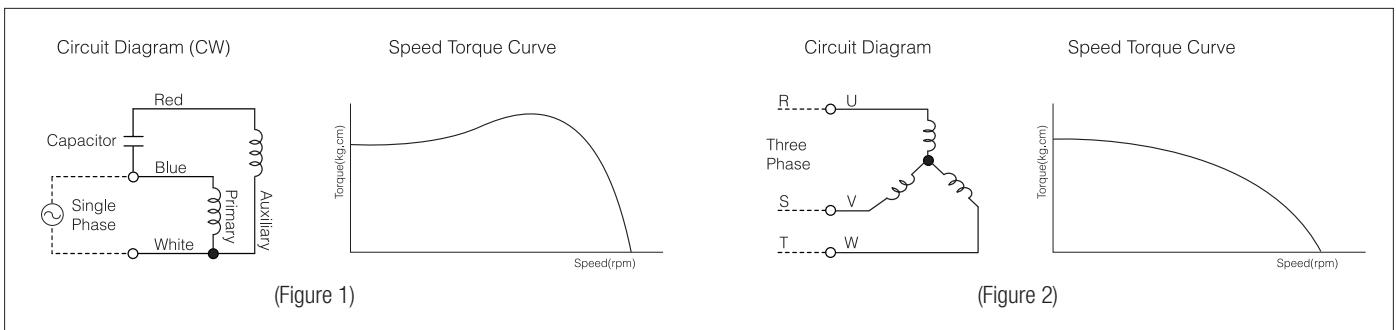

- 交流电机适合于单向连续运行，例如输送带系统。

#### 单相运行

- 对于单相电机的运行，请使用与电机容量相匹配的电容器。对于单相感应电机，短时间内无法改变方向。因此，在运行时首先停止电机并更改方向。(图1)

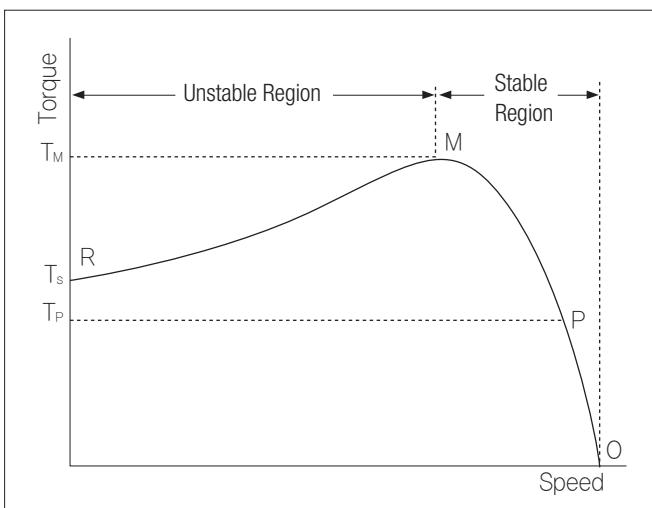

#### 三相运行

- 三相感应电机具有相对较高的启动转矩，与单相电机相比，并且具有高可靠性，因为它可以直接由三相电源驱动。(图2)

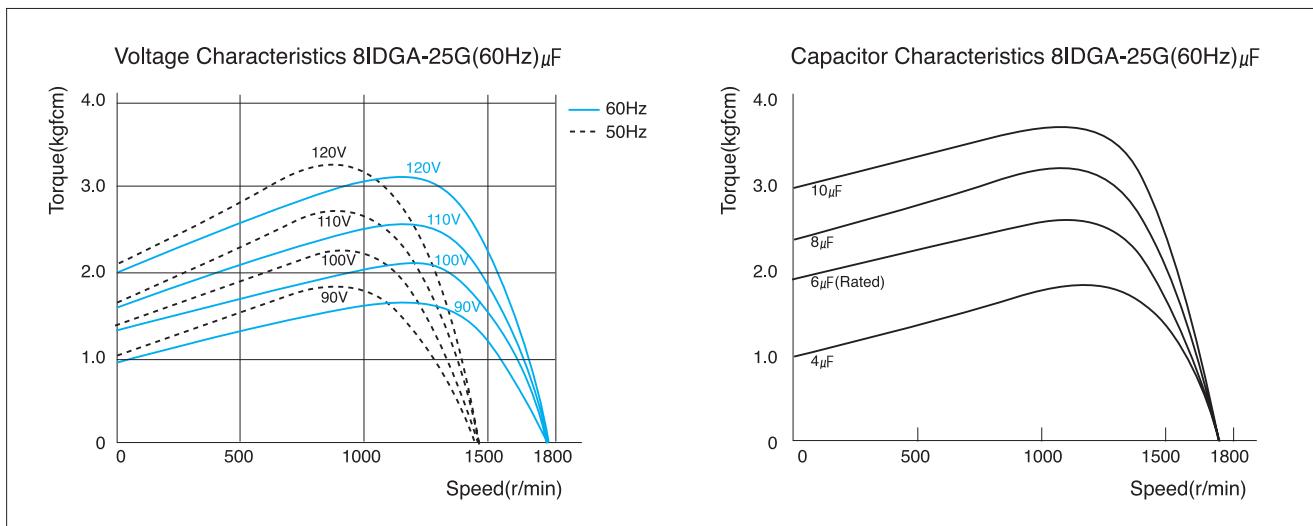

#### 速度与扭矩的关系

- 在恒定功率电压条件下，速度与扭矩的关系如图所示。在空载条件下，转速大致相同。如果负载增加，则转速降低并接近点P，该点表示在点P处扭矩Tp与负载扭矩相等。当负载进一步增加并达到点M时，电机在点R处停止，因为电机不再产生进一步的扭矩。因此，RM段称为不稳定区，OM段称为稳定区。

#### 电压和电容的特征

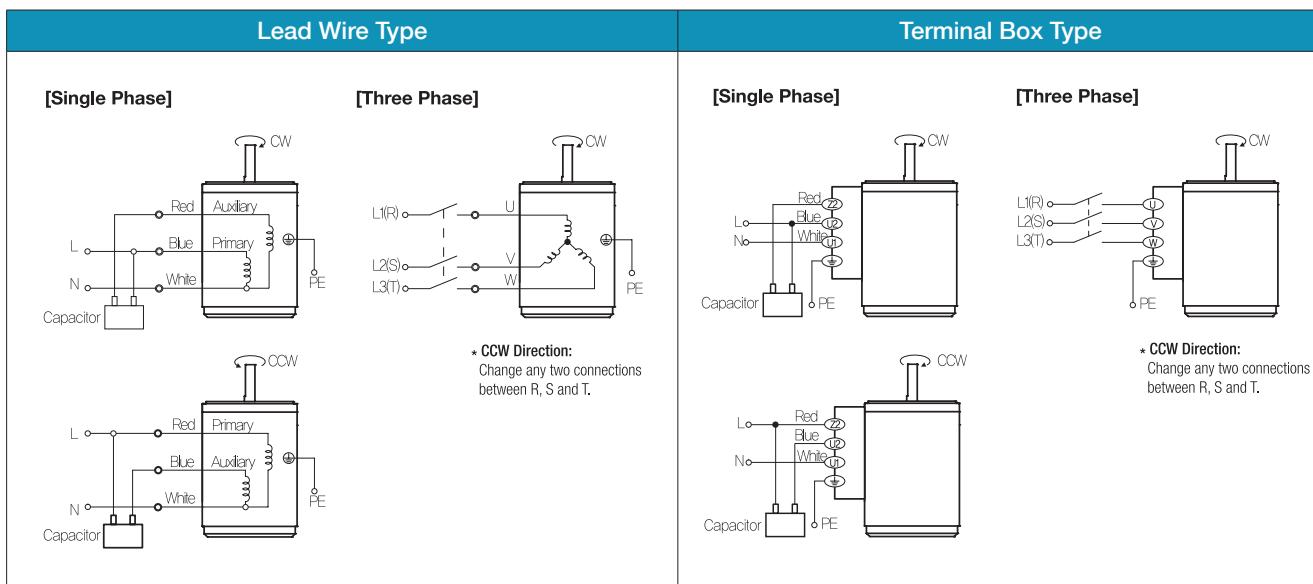

- 通常，感应电机的扭矩与电压成正比，也与电容器的容量成正比。如果电容器的容量增加，则启动扭矩和额定扭矩将增加。但如果容量增加超过2倍，则额定扭矩将减小，而启动扭矩不会增加。当感应电机短缺扭矩时，可以通过增加电压或电容器的容量来继续运行。但请记住，在这种情况下，电机的输入功率增加，温度迅速上升。然而，如果电机必须在不足的扭矩下运行，应采取措施，让电机释放尽可能多的热量，例如安装单独的风扇并保持电机壳温低于90°C。

## General Specifications

Item	Specification
Insulation Resistance	100M $\Omega$ or more when DC500V MEGA is applied between the windings and the frame after rated motor operation under normal ambient temperature and humidity.
Dielectric Strength	Sufficient to withstand 1.5kV at 50Hz and 60Hz applied between the windings and the frame for 1 minute after rated motor operation under normal ambient temperature and humidity.
Temperature Rise	Temperature rise of windings are 80°C or less measured by the resistance change method after rated motor operation with connecting a gearhead or equivalent heat radiation plate.
Insulation Class	Class B [130°C]
Overheat Protection	Operating temperature (Built-in thermal protector type motor): Open 120°C±5°C, Close 90°C±5°C
Ambient Temperature	-10°C~+40°C (Three phase 220VAC: -10°C~+50°C)
Ambient Humidity	85% maximum

## Connection Diagrams

1) The direction of motor rotation is as viewed from the shaft end of the motor. 2) CW represents the clockwise direction, while CCW represents the counterclockwise direction.

3) Change the direction of single phase motor rotation only after bringing the motor to a stop. If an attempt is made to change the direction of rotation while the motor is rotating, the motor may ignore the reversing command or change its direction after some delay.

- Enter the phase & voltage code in the box (□) within the motor model name.
- Enter the gear ratio in the box (□) within the gearhead model name.
- A colored background indicates gear shaft rotation in the same direction as the motor shaft; a white background indicates rotation in the opposite direction.
- The rotating speed is calculated by dividing the motor's synchronous speed (50Hz: 1,500r/min, 60Hz: 1,800r/min) by the gear ratio. The actual speed is 2~20% less than the displayed value, depending on the size of the load.

## Motor Images

## Connection Diagrams

- 1) The direction of motor rotation is as viewed from the shaft end of the motor.
- 2) CW represents the clockwise direction, while CCW represents the counterclockwise direction.
- 3) Change the direction of single phase motor rotation only after bringing the motor to a stop. If an attempt is made to change the direction of rotation while the motor is rotating, the motor may ignore the reversing command or change its direction after some delay.

- 1) Enter the phase & voltage code in the box (□) within the motor model name.
- 2) Enter the gear ratio in the box (□) within the gearhead model name.
- 3) A colored background indicates gear shaft rotation in the same direction as the motor shaft; a white background indicates rotation in the opposite direction.
- 4) The rotating speed is calculated by dividing the motor's synchronous speed (50Hz: 1,500r/min, 60Hz: 1,800r/min) by the gear ratio. The actual speed is 2~20% less than the displayed value, depending on the size of the load.

- Enter the phase & voltage code in the box (□) within the motor model name.
- Enter the gear ratio in the box (□) within the gearhead model name.
- A colored background indicates gear shaft rotation in the same direction as the motor shaft; a white background indicates rotation in the opposite direction.
- The rotating speed is calculated by dividing the motor's synchronous speed (50Hz: 1,500r/min, 60Hz: 1,800r/min) by the gear ratio. The actual speed is 2~20% less than the displayed value, depending on the size of the load.

1) Enter the phase & voltage code in the box (□) within the motor model name.

2) All models contain a built-in thermal protector.

### Dimensions

#### LEAD WIRE TYPE

● MOTOR MODEL: 9IDD□-200F-A (GENERAL FAN)

● MOTOR OUTPUT SHAFT

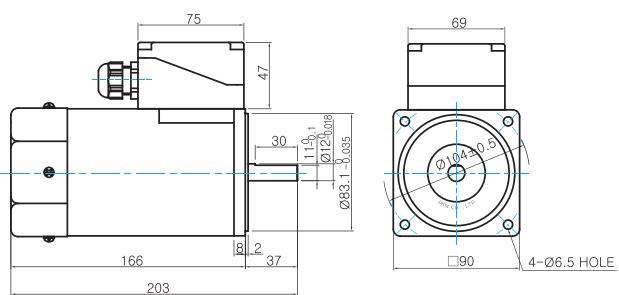

MODEL	SPEC
D-CUT TYPE	37 30 Ø12.0 Ø14.0 Ø14.0 Ø12.0 Ø12.0
9IDD□-200F-A	11.5 2.5 4-Ø6.5 HOLE

● KEY SPEC

#### TERMINAL BOX TYPE

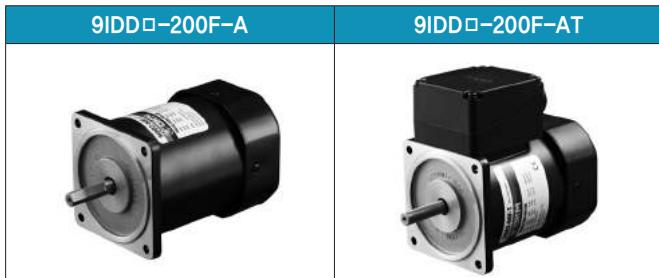

● MOTOR MODEL: 9IDD□-200F-AT (GENERAL FAN)

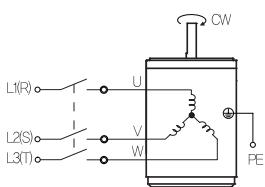

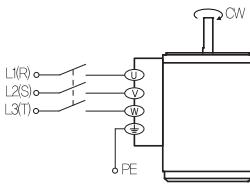

#### WEIGHT

PART	WEIGHT(Kg)
MOTOR	3.8

## Motor Images

## Connection Diagrams

Lead Wire Type	Terminal Box Type
 <p>* CCW Direction: Change any two connections between R, S and T.</p>	 <p>* CCW Direction: Change any two connections between R, S and T.</p>

- 1) The direction of motor rotation is as viewed from the shaft end of the motor.
- 2) CW represents the clockwise direction, while CCW represents the counterclockwise direction.
